### Easy establishment

Red fescue in mixtures often suffers from a slower establishment rate than perennial ryegrass. HEIDRUN performs better and will also perform better in repair/overseeding mixtures.

### Improved wear tolerance

Strong creeping red fescue has average wear tolerance, but through breeding improved performance is observed with HEIDRUN.

### Very high shoot density

Red fescue is fine and dense - nevertheless we added a little more density. There are few chances for weeds to find room to establish.

### Higher salt tolerance

In our salt tolerance trials HEIDRUN has shown performance above the average for the species.
